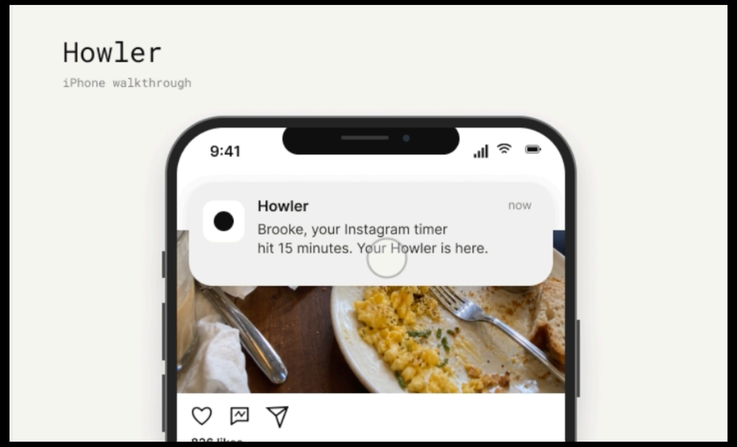
MAS.S60

AI Agents for Cognitive Augmentation

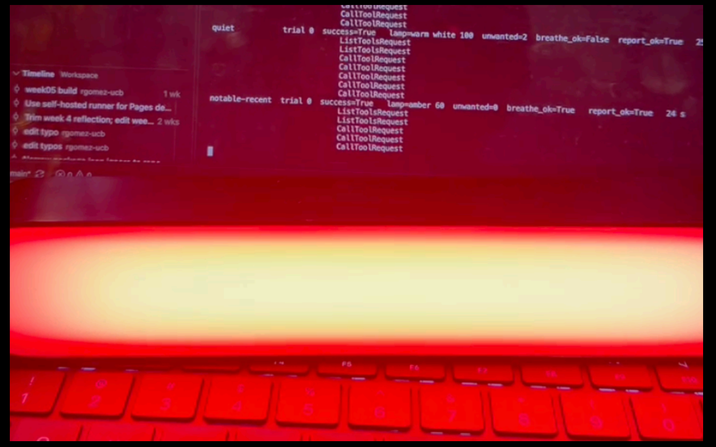
Final Project Proposals

Week 6



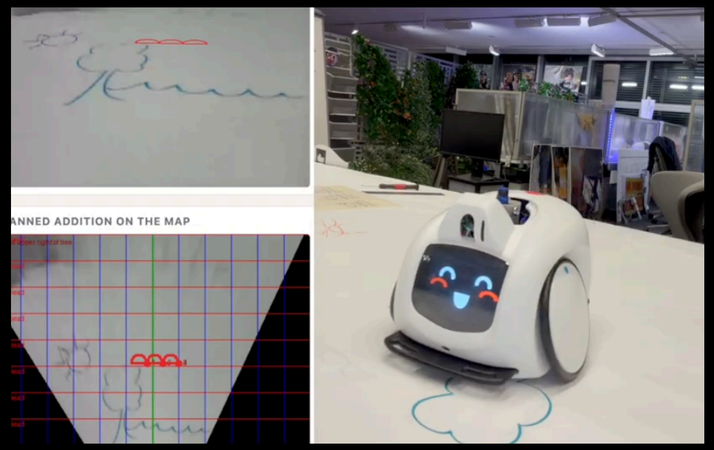
Howler - iOS Use (Brooke)

Smart Lighting - Hue Use (David)



Earthquake Lighting - Hue Use
Egemen + Juan Ruben

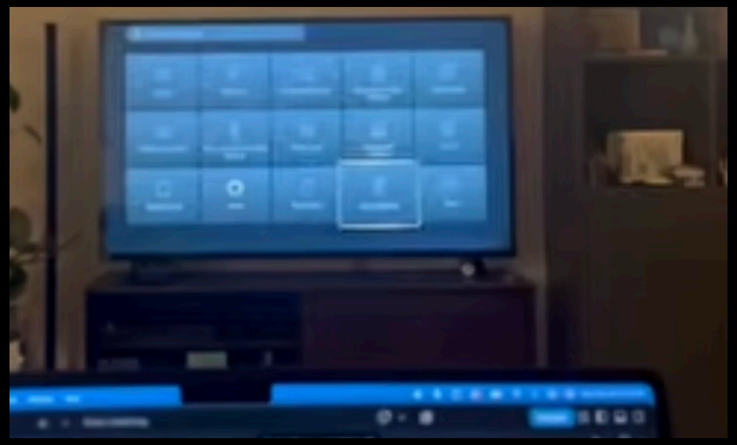
Mantra Glasses Use (Hyung)



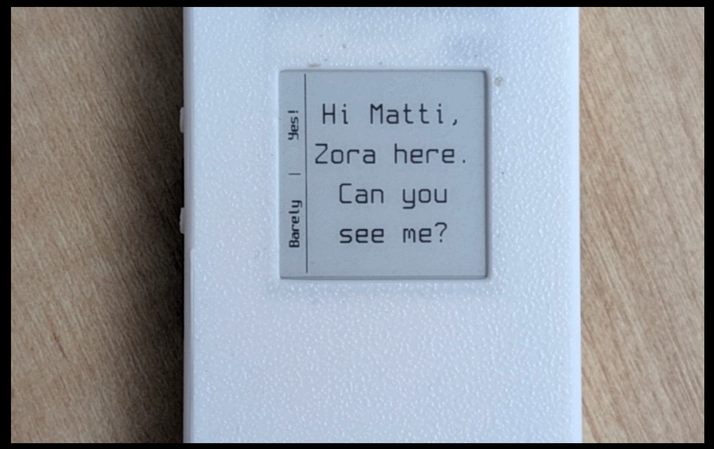
Lang Table (Jad)

iPod Nano (Lilith)

Week 6

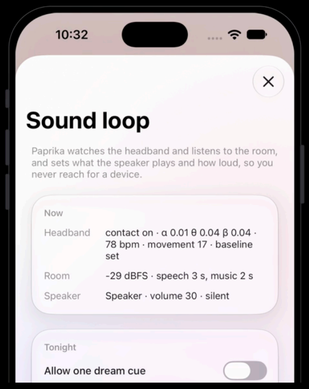


TV Control (Manasi)



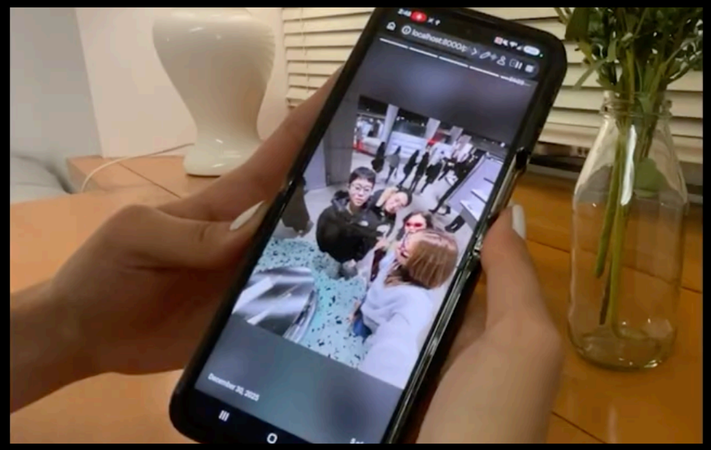
Zora - Old prototype (Matti)

Better pics agent - iOS (Raine)



Headphones and EEG band (Ray)

Robot Arm (Ruipeng)



Fading Memories - Android (Stacey)

Week 6

Blimp (Yuxiang)

Course logistics

1. There is now a class MCP
2. Class survey results (lectures, builds, office hours)

OpenAI has joined the chat

~~Show and tell~~
Final Project Proposals

Zoom Meeting ID:

Find everyone’s presentations on their websites

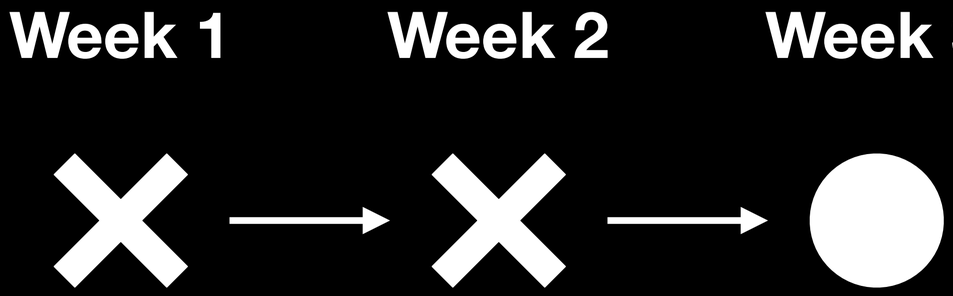
Week 8 Build - Memory & User Modeling

. Personalization feature on course agent
. Teams of 3-4 people

How can a course agent remember, adapt and personalize to the students (you!) to augment class learning outcomes, motivation, social interaction or engagement? OR how could it augment the instructors?

Keep learning history and weaknesses of each learner so show them improvement stats

Distinguishing MCP vs. tools



InquiryBits: Sharing AI Conversation Traces to Support Collaboration Within Trust Boundaries

Abstract

AI chat tools are shifting problem-solving and brainstorming conversations away from colleagues and into private AI interactions, reducing the shared awareness that supports team coordination. We introduce InquiryBits, a system that shares minimal summaries of AI conversations within configurable trust boundaries, separating AI-only analysis from human-visible sharing. In a study with 80 professionals, we find that people are broadly willing to share these traces to support collaboration and avoid duplicating work - but only within bounded groups. Comfort drops sharply as audience expands beyond close teams; the level of detail shared matters less than who can see it, with a preference for more detail over less within trusted groups. These findings suggest that trust boundaries, more than information granularity, may be the most impactful design parameter.

CCS Concepts

1 Introduction

Collaborative teams rarely coordinate by sharing fully formed work. among peers and colleagues are queried privately through tools like ChatGPT or Claude [5]. The individual benefits are apparent: this process is faster and sometimes more reliable. However, in this shift, teams lose some of the informal visibility that helps support distributed cognition.

This creates an opportunity as much as a problem. AI conversations produce rich traces of cognitive process, from approaches and confusions to solutions. These traces could support coordination if shared appropriately. Two teammates independently working through similar problems could save significant time by discovering each other's progress [1]. However, sharing one's thinking process is much more vulnerable and sensitive than sharing results. One participant in our study noted the concern of feeling "like a fraud that I've had to ask for help on something that someone else may perceive that I should know."

We introduce InquiryBits, a prototype that investigates this tension by exploring how small a shared representation can be while still enabling useful discovery. We test lightweight signals - topic labels and filtered synopses - that might allow discovery of collaboration opportunities without requiring full transparency. The system matches based on what people are actively working on, rather than declared expertise. When overlap is detected, users decide whether to share - and with whom - within configurable trust boundaries.

This paper makes three contributions. First, it introduces a tiered visibility architecture that separates AI-only analysis from human-visible sharing. Second, it provides empirical evidence from a study with 80 professionals showing that trust boundaries may matter more than information granularity in determining sharing comfort. Third, it identifies design implications for AI-mediated awareness systems that aim to support coordination without creating a sense of surveillance.
